experience using a two-stage pyloric myotomy for the treatment of
pyloric stenosis. Although surgical treatment of refractory pyloric stenosis
is most commonly performed in children, many surgeons are reluctant to
perform a 2-stage procedure because of the associated morbidity of
having a truncal incision. We present our single-center experience in a
limited number of patients with severe pyloric stenosis and the outcomes
of a 2-stage approach. Patients who underwent a 2-stage procedure for
pyloric stenosis were identified retrospectively by searching the
departmental pathology database. Demographic and clinicopathological
data were collected. We performed a univariate and a multivariate
analysis comparing the 2-stage patients with those that did not undergo a
2-stage procedure. We identified 34 patients who underwent a total of 40
2-stage procedures. The median time to a second procedure was 2
